

Required Edit of Config File for Launch

Ver Mar112024

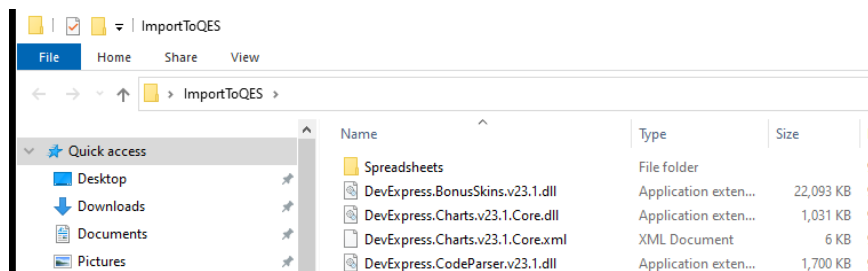

Enable Successful Launch of Import Tool

Editing the configuration file in notepad or another text editor **is required** to successfully launch and use the Data Population tool for QES.

The **edit** will point the import functions to the **named** database. Please confirm the database is correctly identified in the file. If the database is not found the tool may not respond or may indicate that there is a security issue with launch.

Edit importtoqes.exe.config file

Extract the file ImportToQes .zip

Scroll through the available files and use Notepad to open the file importtoqes.exe.config for editing. Before making changes capture the contents of the file so that you can confirm that edits were accurately replaced.

Note, in some cases, if the file is not opened as an administrator, then it is possible the user will not be able to save the edited file.

Edit the contents of the file by locating the section **<connectionStrings>** and locating each of these four specific sections:

Data source=

User id=

Password=

Initial Catalog=

For these references update after the equal sign with content from your setups. There are no spaces after the =

Data source= enter the name of the SQL server instance, in the example below you will replace PRES08 with the name of your sql server instance. In appendix 1 is a tip for obtaining the instance name.

User Id= is the administrator user id for your SQL database, it is expected to be sa.

Password= should be the password for the sa user to access the sql server. In the example below it is Horizons1.0

Initial Catalog=enter the name of your sql database in the example it is StandAlone

Save the file

Example of Config file with original entries

```
<?xml version="1.0" encoding="utf-8"?>
<configuration>
<configSections>
</configSections>
<connectionStrings>
  <!--<add name="QESCon" connectionString="XpoProvider=MSSqlServer;data
source=localhost\SQLEXPRESS;integrated security=true;initial catalog=StandAlone;" />-->
  <add name="QESCon" connectionString="XpoProvider=MSSqlServer;data source=PRES08;user
id=sa;password=Horizons1.0;initial catalog=StandAlone;Persist Security Info=true" />
</connectionStrings>
<startup><supportedRuntime version="v4.0" sku=".NETFramework,Version=v4.7.2"/></startup>
</configuration>
```

Troubleshooting Failed Launch

1. Export to Data Table form fails to appear. Generally, this means that the edits in the config file were incorrect or incomplete, often this is related to transposing of characters or missed punctuation when the config file was edited.
2. Message indicating Windows defender or another security tool prevented the application from launching. Generally, this means that the edits in the config file were incorrect or incomplete, often this is related to transposing of characters or missed punctuation when the config file was edited
